On Nov 27, 2000 this sequence version replaced gilefysision
This updated annotation replaces the old annotation from reference
This updated annotation replaces the old annotation from reference
The old gene identifiers (MP numbers) according to the original
publication by
Himmelreich et al. (1996) are given as well as new gene numbering
(MPN numbers) from the origin of replication. Annotation comments
and further undate data are at
http://www.bork.embl.heidelberg.de/Annot/MP/.
                                                                                                                                                Mycoplasma pneumoniae M129 section 15 of 63 of the complete genome. AE000002 U00089
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RLICTHEFPHKQVFCVGDFKEINFPWLEMVFTPKEQITFELMQQALAVIVDANYKERIEC

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = asparagine, X = any amino acid other than proline, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA molecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as a fusion protein; (2) a recombinant virus integrated with the DNA molecule described above; (3)

producing a modified or fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule has virucide and immunostimulant activities. The DNA molecule is useful for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                             9

                                                                               This sequence represents DNA encoding an antigenic protein of Mycoplasma antibody (MAD) 35A6. This antigenic protein inhibits the metabolism of bird infecting mycoplasma. The antigenic protein and the DNA molecule can be used in the preparation of component and viral vaccines against expoplasma infection in birds. Mycoplasma infection can be diagnosed by hybridising DNA in a sample with a DNA probe corresponding to 10 or more (preferably 15 to 40) bases of the antigenic protein gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention relates to a novel avian vaccination against virulent strains of Mycoplasma gallisepticum. The vaccination comprises administering to a bird an immunogen comprising a cytadherence-deficient M gallisepticum having an inability to express at least two of three of the following proteins expressed by wild-type M. gallisepticum, of the invention may have virucide activity and may be used as a virucide. The vaccine is useful for preventing M. gallisepticum virus infection in birds. The present sequence represents the DNA sequence encoding the Mycoplasma gallisepticum vaccine of the invention. This sequence contains the coding sequences of the Gap-A, crmA and 45kDa proteins which are not expressed in cytadherence deficient M.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          3898 TTAGTTAATCAAGCAAGAACGCTAGATGCTAATTCTGTTAGACTTGCAGGTCTTGGACAA

This invention describes a novel gene transfer vector (NI) which comprises (1) a first nucleic acid sequence (1) encoding one or more light trigger apoptosis; (2) a second nucleic acid sequence (II) encoding one or more antigens; and optionally (3) a third nucleic acid sequence (II) encoding one or more anti-apoptosis molecules; and sequence (III) encoding one or more auti-apoptosis molecules; and captured nucleic acid sequence (IV) encoding one or more suicide enzymes. The products of the invention have antiaframmatory, immunomodulatory, rheumatic, arthritic and dermatological activity and can be used in gene therapy. The gene vector may be used to produce medicine for the prevention or therapy of autoimmune diseases, such as rheumatoid arthritis, systemic lupus erythematosus, Sjoegren-Syndrome, polymyositis, dermatomory throiditis, polymydigica, rheumatism, arterificis temporalis, Crohn's disease, Bediterew disease, colitis ulcerosa, autoimmune hepatitis, diabetes mellitus (type I), suprarena body autoimmune hepatitis, diabetes mellitus (type I), suprarena body autoimmune hepatitis, diabetes mellitus (type I), suprarena body autoimmune sacciated with chronic inflammation, the target immunopathogens, particularly hepatitis B or C infections or of the immunopathogens, particularly inflammation associated with viral or bacterial infection, particularly hepatitis B or C infections or of the inflammation of the brain after infection from Masern virus, or transplant rejections. The vector may be used in ex vivo modification of animal or mammal cells, particularly human cells missequence arised on the sequence of animal or mammal cells, particularly human cells and contains the suicide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             98.6%; Score 3143.4; DB 5; Length 10651; 99.1%; Pred, No. 0;

The present invention describes a DNA molecule derived from a prokaryotic cell, where at least one of the DNA regions encoding NXB (where N = saparagine, X = any amino acid other than profile, and B = serine or threonine) has been modified so that no N-glycosylation occurs during the expression in a eukaryotic cell. Also described: (1) a fused DNA collecule, where a DNA encoding a signal sequence has been ligated to the N-terminal end of the modified DNA molecule as described above so that it may be expressed as fusion protein; (2) a recombinant virus integrated with the DNA molecule or the fused DNA molecule described above; (3) producing a modified of fusion protein by using the recombinant virus described above, to express a protein encoded by the modified DNA molecule or the fused DNA molecule in a eukaryotic cell; and (4) a vaccine comprising the recombinant virus. The DNA molecule for producing a vaccine for treating viral infections. The present sequence is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to an isolated nucleic acid comprising any one of the 513 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are: (1) a vector comprising a promoter operably linked to the nucleic acid

encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, or that has an activity against a biological pathway to proliferation, or that inhibits cellular proliferation agence or which the proliferation or the biological pathway in which a proliferation. (8) identifying a gene required for required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolifing a compound; a activity; (11) a culture comprising strains in which the gene or organism acts; (9) manufacturing an antibiotic; (10) prolifing the extent to which each of the strains is present in a culture or collection of arrains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational dentifying proteins or screening for homologous nucleic acids required for cellular proliferation in cells other than S. aureus, S. typhimurium, R. pneumoniae or P. aeruginosa. The present sequence is one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from Wipo at the present sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2770 TITGGCGCCTTACCTTCATGGGTAGTGCCTACAGCAATTGGTAGTACATTAGGTATTCTT 2829

```
The sequence encodes a cytadhesin protein from Mycoplasma gallisepticum. All or part of the sequence may be used as a probe for diagnosis of M. gallisepticum infection in poultry, e.g. turkey or fowl. The sequence has several UGA codons, which may be eliminated to avoid problems of expression in vitro due to irregular codon usage. The sequence may be cloned in a vector for recombinant cytoadhesin production, for use as an antigen in immunoassay formate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          acid encoding cytadhesin protein - used as a probe to diagnose Mycoplasma gallisepticum infection in poultry.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The M.pirum adhesin gene was isolated using a probe based on the 3'- end of the known M.geniralium adhesin gene. M.pirum is found in AIDS patients and the adhesin may have a role in Infection of cells by HIV. If so, the M.pirum adhesin protein will be useful in vaccines to protect against the cytopathic effect of the Mycoplasma and against that of HIV. (Updated on

The present invention describes a purified Anopheles gambiae olfaction polypeptide comprising a 383, 394, 380, 411, 412, 391, 157 or 401 residue modified acid sequence (see ABP52840) ($31), a conservatively modified amino acid sequence of them, or a sequence of ($31) with at least comprising: (a) a nucleotide sequence encoding the purified Anopheles comprising: (a) a nucleotide sequence encoding the purified Anopheles gambiae olfaction polypeptide; or (b) a nucleotide sequence that hybridises under stringent conditions to a hybridisation probe comprising a 1964, 1239, 1142, 1236, 1194, 1176, 474 or 1206 nucleotide sequence hybridises under stringent conditions to a hybridisation probe comprising a 1964, 1239, 1142, 1236, 1194, 1176, 474 or 1206 nucleotide sequence complement; and (2) a method for lofentifying an agent that binds to mosquito olfaction molecules (b) contacting a test agent with the isolated mosquito olfaction molecule, and (c) detecting specific binding of the test agent to the isolated mosquito olfaction molecule, and (c) detecting specific binding of identifies the test agent as a mosquito olfaction-binding compound. The mosquito olfaction molecules are useful for mosquito management, i.e. controlling this pest and disease vector. A

The present sequence is that of genomic DNA encoding a novel mosquito relegation melecule, odorant receptor 2. A cDNA sequence for odorant receptor 2 is given in ACF79719. The invention provides 9 novel mosquito polypeptides and the nucleic acids encoding them. These are odorant receptor molecules 1-7 and arrestins 1 and 2. The odorant receptors function in a ligand-induced signal transduction pathway for the activation of mosquito olfaction. Arrestin functions to inhibit the activated signal transduction cascade. Thus, the odorant receptors act as an 'on' switch, and arrestin as an 'off' switch for the odorant detection system of the mosquito. Methods are provided for identifying compounds that interfere with the operation of the mosquito olfactory system.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ATARARARARACARTARTARACARTARTARGARTARCARCARCARCARTARTARGAR 3011

The sequences can be used in the diagnosis and treatment of immune system disorders, including eye diseases such as retinopathy, neovascular glaucoma and macular degeneration, arteriosclerosis, anaemia, cancer, acute myeloid leukaemia, Alzheimer's disease, Allos, epilepsy, neurofibromatosis, rheumatoid arthritis, psoriasis and inflammatory/ulcerative bowel diseases. The present sequence is a gene of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               376 CAAACAAGAGCATATTATGCTCTGTTGGTTAATGATGAAGCTAACGTTCATTTAAAAAGA 435

(KSHV) latency-associated nuclear attigen (LANA) gene. KSHV is also known as Human Herpes Virus and belongs to the rhadino virus, or gamma -2 herpes virus class. The LANA protein is necessary for the efficient persistence of rhadino virus bNa in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. Kaposi's sarcoma (KS), Primary Effusion Lymphoma (PEL) and multicentric catcheman's disease. In addition, KS is a common malignancy in HIV persists in host cells in a latent form. One of the few comes expressed from the latent viral DNA is LANA associates with both human chromosomes and with the rhadino virus cis-acting element comes expressed from the latent will blais in the viral DNA to persist in the host chromosomes. This allows the viral DNA to persist in the host call. The present sequence may be used to screen and identify molecules that inhibit LANA interaction with RVCAE, thereby interfering molecules that inhibit LANA interaction with RVCAE, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the above mentioned diseases may therefore be based on LANA deregulation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2116 gérchrediécrécréredrehretrechécrécretrerrécrécrécretrerretr 2057

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠે
                                                                                                                                                                                                                                                                                                                                                                    The invention provides a composition comprising nucleic acid, histone HI protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the tethering protein is LANA. The composition is useful in aiding the retention of the viral DNA in the host cell. The viral vector encodes a protein suitable for tethering DNA to Histone HI. Methods for screening or protein suitable for tethering DNA to Histone HI. Methods for screening or viral proteins to histone HI and DNA binding sites are useful for viral proteins to histone HI and DNA binding sites are useful for to gene therapy, including the treatment of multiple sclerosis, parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Kaposi's sarcome associated herpesyitus (human herpesyitus 8) latency-associated nuclear antigen (LANA), which acts as a tethering protein. The present invention describes a system (A) for maintaining a plasmid as an episome in mammalian cells, comprising the rhadinoviral sequence LANA (latency-associated nuclear antigen) of 3489 base pairs (see ABA93487, 51) expressed in the cell, and the rhadinoviral sequence RVCAE present in the plasmid. Also describes is a method for maintaining a closed circular DNA in a cell by expressing (S1) in the cells and having (S2) as a cis-acting and maintenance sequence in the DNA. (A) is particularly used in gene therapy (or other gene transfer applications) that uses mammalian cells in which LANA is expressed. (A) improves persistence of gene therapy vectors in cells. The present sequence codes of gene therapy vectors in cells. The present sequence herpewirus 8) LANA protein, which is used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                useful in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 2236 CATCCTGCTGCTGCTGCTCATCCTGCTGCTGCTCATCCTGCTGCTGCTGCTGCTCATCCT

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 1, Application US/08728323A

Patent No. 5948676

GENERAL INFORMATION:
APPLICANT: Chang, Yuan
APPLICANT: Bohenzky, Roy A.
APPLICANT: Belman, Isidore S.
APPLICANT: Belman, Isidore S.
APPLICANT: Musso, James J.
APPLICANT: Moore, Patrick S.
TITLE OF INVENTION: Immediate Early Protein From Kaposi's TITLE OF INVENTION: Barcoma-Associated Herpesvirus, DNA
TITLE OF INVENTION: Bracoding Same And Uses Thereof
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: Cooper & Dunham LLP
STREET: 1185 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         2.5%; Score 78.4; DB 1; Length 4182; 98.8%; Pred. No. Se-09; tive 0; Mismatches 1; Indels 0
                                                                                                                                                                                                                                                                                                                       MEDIUM TYPE: 3.5 inch diskette
COMPUTER: IBM/PC or Compatible
OPERATING SYSTEM: MS-DOS
SOFTWARE: Wordperfect 5.1
CURRENT APPLICATION DATA:
